Anthropometry outcome variables at 69-71y (Phase 1 Insight 46) (2019-CL)

Height (recorded to the nearest mm) and weight (in kg to the nearest 0.1kg) were measured at the Phase 1 Insight 46 visit by a trained Clinical Research Associate.

Height was measured with shoes off and feet together, standing on the base plate of the stadiometer. The head was tilted to the Frankfort plane position, so that an imaginary line passing through the external ear canal and across the top of the lower bone of the eye socket immediately under the eye would be parallel to the floor (i.e. horizontal).

Weight was measured using calibrated weighing scales and the participant wearing skirt or trousers and shirt, but no jacket or jersey and no shoes.

Body mass index (BMI) at the Insight 46 visit was derived using the equation weight (in kg)/height2 (in metres).

Measures were available for all 502 individuals.

Variables

htn1517_i46p1 – height in mm
